

LAN-TEL has a unique, proven six-step process that ensures your company has the solutions it needs to be successful today and, more importantly, in the future. LAN-TEL's knowledgeable and experienced staff has proven success in using its six-step process to work with all types of businesses to implement state-of-the-art solutions that provide long-term value because they are scalable, adaptable and designed to meet both present and future technology needs.

Step 1: Needs Assessment and Evaluation

LAN-TEL's experienced engineers and designers will conduct an evaluation of your technology infrastructure and work with you to identify your present and future technology needs. Based on the evaluation, we will propose the voice, data, video and security designs and applications that will best help your business to be successful.

Step 2: Design and Engineering

Our technical staff will design a custom state-of-the-art network that meets the needs and requirements identified in Step 1. The design will adhere to all the latest industry standards and will be adaptable and scalable to ensure your future technology needs are met cost-effectively and with ease.

Step 3: Project Management

LAN-TEL firmly believes that flawless project management is a key ingredient in the successful deployment of technology solutions; therefore, our staff consists of some of the most experienced project managers in the industry. Our project managers have proven track records in completing projects on time, within budget, and most importantly, with a minimum amount of involvement required on your part. They know how and when to provide you with real-time information and updates about your project, and how to ensure the project is completed with minimum interruption to your workplace.

Step 4: Construction and Installation

Because LAN-TEL has been in business since 1991, it has some of the most well-trained and knowledgeable technicians in the industry. Our technicians have extensive experience in installing voice, data, video and security systems for a wide variety of clients, and know how to work with our customers to deliver a high-quality product on time and within budget.

Step 5: Testing, Warranties and Documentation

LAN-TEL stands behind all work it completes and provides standards-based certifications and manufacturer's warranties. Additionally, LAN-TEL has invested in the latest test equipment so it has the capability to thoroughly test all technology solutions it installs. Unlike some companies, we do not consider a project complete until diagnostic test results are thoroughly documented using the latest test equipment available. LAN-TEL also provides its clients with clear and accurate documentation of the network we have designed and installed so that future maintenance and upgrades can be easily completed.

Step 6: Change Management and Ongoing Service

Who better to take care of your ongoing technology needs than the company that completed the original design and installation? Because we design your network with the future in mind, we are well positioned to implement changes, moves, adds, and upgrades that may be required as your business continues to evolve and grow.
